NOTICE

A Rare & Curious Lily Bulb

Growing in our window at 1525 Champa Street

It is known as "AMORPHOPHALLUS RIVIERI"

You are invited to watch its progress. The probable date of blooming is April 20 to 25th.

This curious bulb will send up a single stalk to a height of about three to four feet at which time the blossom will appear. The bloom will be about 16 inches in diameter and resemble a giant Calla Lily.

After blooming the stem will continue to grow to a height of about 8 feet when giant palm-like leaves will appear. Half of Denver is watching the progress of this strange and rare bulb and our out-of-town customers and friends are invited to come and see it.

We will gladly notify anyone interested as soon as the bloom begins to open; it will remain in bloom for several days making it possible for those interested to come to Denver to see it while in bloom.

Brussels Sprouts

A very delicate vegetable and deserves a more general cultivation than they receive. The plant belongs to the Cabbage family and should be grown and cultivated like Cabbage. The "sprouts" which grow around the strong, upright stems of the plant, look like miniature cabbages. One ounce will produce 2,000 plants.

Half-Dwarf Improved. Bearing a large crop of small, solid, tender heads. Pkt. 5c; oz. 10c; ¼ lb. 65c; lb. $2.00.

Cabbage

CULTURE. One ounce of good seed will produce 2,000 plants. For early Cabbages sow the seed in a hothed in March or April, covering the seed from one-quarter to one-half inch deep and when big enough transplant to another bed. As soon as the ground is in good condition, transplant outside in rows 2 feet apart and 15 to 18 inches in a row. The soil should be mellow, rich and well drained. For late crops the seed can be sown in a cold frame or even in the open ground, and then transplanted in rows 3 feet one way and 2 feet the other, so as to be able to work with a horse and cultivator. One ounce of salt-peter dissolved in 3 gallons of rain water, sprinkled over the Cabbage or Cauliflower will destroy the green worm. The liquid being clear does not color the Cauliflower or Cabbage heads. Fine air-slacked lime or tobacco dust sifted on the young plants as soon as the fleas appear on the ground will prevent them from doing harm.

Earliest Varieties

Copenhagen Market. The earliest round head, short stem Cabbage offered today. The heads are even in size of about 8 lbs. average and will stand longer than other early varieties without bursting. Pkt. 5c; oz. 25c; ½ lb. 80c; lb. $2.50.

Carrots

One ounce will sow 100 feet of drill; 3 to 4 lbs. for an acre.

CULTURE. Carrots may be sown in hotbeds in February for early use. In open ground from March to first of July; however, main crop will produce best results if sown from first of May to first of July. Thin out early plantings to 5 inches apart in the row and main crop 6 to 8 inches apart. The rows should be 10 inches apart for early crop and 15 to 18 inches for main crop. Cultivation should be carefully performed to keep down the weeds, and deep hoeing between the rows will give a large increase in the crop. Carrot tops, cut from young plants, may be used for garnishing.

Ox Heart, or Guerande. Especially desirable for clay soil. Root is short and thick and flesh is bright orange in color. Heart is tender and not woody. Pkt. 5c; oz. 10c; ¼ lb. 35c; lb. 90c.

Cauliflower

One ounce will produce 3,000 plants. Cultural directions for Cabbage apply to this crop, but the soil should be more heavily manured. Keep ground well hoed, and bring earth gradually up to stems. Water freely, especially when they begin to head. Never allow plants to become crowded in seed-bed; transplant them with great care, as any check will injure, if not prevent formation of the head. For late Cauliflower, set plants in a cool, moist place. When heads form, the long leaves should be drawn over and tied above them, to keep off sun and rain.

Henderson's Early Snowball. One of the best types on the market. Its compact habit of growth renders it a very profitable variety to force under glass, and it does well for late planting, as well as for early crops. A sure header. Pkt. 15c; ¼ oz. 50c; ½ oz. $1.50; 2 ozs. $2.75; ¼ lb. $5.00.

Early Paris. Medium size. Pkt. 10c; ¼ oz. 30c; oz. 80c; ¼ lb. $2.50; lb. $8.00.

Celery

CULTURE. The conditions necessary for successful Celery cultivation are good seed, plenty of manure and complete fertilization, moisture and cultivation. The most suitable soil is rich loam, finely pulverized and highly enriched with 30 to 40 loads to the acre of good stable manure. Sow seed in boxes for early planting; later plants may be produced from seeds sown in frames or open ground. Transplant 4 inches apart when 3 inches high, water and protect until well rooted, then transplant into rows for garden culture 18 inches to 2 feet apart, for field culture in rows 4 to 6 feet apart; set the plants from 8 to 12 inches apart, supply plenty of moisture and see that plants receive thorough cultivation. They may be set either on the surface or in well manured trenches 1 foot in depth. To blanch draw earth around the plants, being careful not to cover the tops of the center shoots.

Giant Pascal. By far the most popular Celery. Medium to small size, but wonderfully well flavored. Pkt. 5c; oz. 20c; ¼ lb. 65c; lb. $2.00.

Lettuce

CULTURE. Sow in hotbed or boxes in February or March and in open ground as soon as it can be worked; transplant to rows 8 inches apart both ways. Extra rich, mellow soil, high cultivation and moisture are demanded by lettuce to secure best results. Lettuce is hardy and makes better growth when mercury is below 60 degrees; when above 75 degrees the plant is soon drawn out of shape. A succession of plantings, at intervals of two weeks, after first outdoor planting is desirable. In August any of the varieties can be sown either outdoors or in frames. In October, Grand Rapids and Denver Market, may be planted in frame to head in winter. Always sow seed thin and then thin out plants to stand from 6 to 8 inches apart in row. Lettuce requires good soil, carefully enriched with well rotted manure, and well pulverized to secure the best results. For hothed and very early sowing, we especially recommend Big Boston, Grand Rapids, Early Curled Simpson and Black Seeded Simpson.

Cantaloupes and Cucumbers are often destroyed by lice and should be well sprinkled with slug shot when the plants appear. CULTURE. The soil for radishes should be very rich, light and mellow, well broken by digging, as their tender and mild qualities depend much upon their rapid growth. For very early use, sow in gentle hotbeds in February, and in open air as soon as the ground can be worked; then at intervals of ten or twelve days, for a succession as long as they may be wanted. The winter varieties should be sown in August, lifted before severe frost, and stored in the cellar. Sow in drills 1 foot apart and cover lightly; thin out while small to 3 inches apart. Hoe often.

- **Mammoth Sandwich Island.** This splendid variety grows to fully double the size of the old sort; is of superior quality and delicate flavor. The Oyster Plant is one of the most nutritious and delicious vegetables and should be more generally cultivated for winter use when the supply of really good vegetables is limited. No market gardener should fail to grow it. It is a paying proposition. Pkt. 5c; oz. 15c; ¼ lb. 50c; 1 lb. $1.40.

- **Spinach**

One ounce will sow 50 feet of drill; 12 to 16 pounds to acre

CULTURE. This is a very important crop in our market gardens, and is one of the most easily managed of all vegetables, requiring but little culture and may be had fit for use the entire season. The main crop is sown in September. It is sometimes covered up in exposed places with straw or salt hay during winter, which prevents it from being cut by frost; but in sheltered fields there is no necessity for covering. For summer use it may be sown at intervals of two to three weeks from April to August. Spinach is best developed and most tender and succulent when grown in rich soil.

Long Standing. The best for spring sowing. Stands a long time before shooting to seed. Large thick leaves, excellent for use the entire season. The main crop is sown in September. It is sometimes covered up in exposed places with straw or salt hay during winter, which prevents it from being cut by frost; but in sheltered fields there is no necessity for covering. For summer use it may be sown at intervals of two to three weeks from April to August. Spinach is best developed and most tender and succulent when grown in rich soil.

New Zealand. Makes a luxuriant growth all summer. In appearance entirely distinct from other spinach. Its quality is very desirable and tender. Soak the seed in warm water before planting. Pkt. 5c; oz. 10c; ¼ lb. 25c; 1 lb. 75c.

Monstrous Leaved Viroflay. Quick, strong growth; much used by New York truckers. Pkt. 5c; oz. 10c; ¼ lb. 20c; 1 lb. 60c.
Squash

One ounce will plant 30 hills; 3 to 4 pounds an acre.

CULTURE. The plants are very tender and sensitive to cold, and planting must be delayed until settled, warm weather. The general principles of culture are the same as those given for cucumbers and melons, but the plants are less particular as to soil. The summer varieties should be planted 4 feet apart each way and the winter sorts 8 feet. Three plants are sufficient for a hill. Care should be taken not to break the stems from the squashes intended for winter use, as the slightest injury will increase the liability to decay.

Summer Varieties

Yellow Summer Straight Neck. Similar in all ways to the Crook Neck except that it grows straight. Packs better. Pkt. 5c; oz. 10c; ¼ lb. 30c; lb. 90c.

Sweet Corn

One pound will plant about 180 hills; 10 to 12 pounds to an acre, in hills.

CULTURE. Sweet Corn should not be planted very early in the season; the soil must be warm and should be a rich loam. If planted too early the seed is apt to rot. Sweet Corn will not make any progress until the weather is warm. If possible select a sheltered location for the very early kinds. A succession can be continued with the later kinds by planting at regular intervals from June to middle of August, thus insuring a continuous supply of table corn throughout the summer and fall months. Plant the small early varieties in drills 2½ feet apart and 10 inches apart in the rows. The taller varieties should be planted in drills 3 feet apart and 12 to 14 inches apart in the rows. Rich manure worked into the soil will increase the crop.

Don’t Wish for a Better Lawn—Have One

Here is a new tool, filling a long felt want. SPIKE-TAMP is a new unbreakable tool that quickly reverses from a Spiker to a Tamper.

Spiking the lawn allows air and water to enter and breaks up that hidebound condition of the turf, cultivating it properly. A good lawn should be spiked once or twice every season. A poor lawn, if properly fed, will become good after spiking.

When seeding or fertilizing, Spike-Tamp is simply invaluable. Tamping prevents washing away of new seed, and Spiking an old lawn improves aeration and absorbing of water by the soil. Bacterial action is quickened and improved color of the grass is at once apparent.

SPIKE-TAMP complete and ready to use, $3.50 Not Prepaid.
Simpson's Hi-Test Grass Seeds

No home is complete without a GOOD, WELL KEPt UP LAWN, and no lawn will present a green, velvety appearance throughout the summer unless it was produced from the proper mixture of grass seeds and is nourished by frequent applications of a proper, well-balanced plant food. See pages 33 and 34 for the correct FERTILIZERS for lawns.

We firmly believe that in nine cases out of ten a base of pure Kentucky Blue Grass Seed makes the best lawn, but as Kentucky Blue Grass is somewhat slow in starting, it is usually advisable to use other seeds in the proper proportions with Kentucky Blue Grass, in starting a new lawn.

Remember, also that grass can not be maintained on a diet of water alone, any more than can the human body. Lawns MUST BE FED a properly balanced plant food to hold that bright, velvety green appearance we all so much desire.

FREE!—An 8 page folder "HOW TO MAKE AND MAINTAIN A LAWN!"

SPREADING BARNYARD MANURE ON YOUR LAWN MAY ENDANGER HUMAN LIVES. SCIENTISTS HAVE PROVED THAT GERM OF DEADLY GAS GANDRENE AND LOCKJAW ARE CARRIED BY MANY ANIMAL MANURES.

BEST CONTROL FOR POULTRY LICE

Black Leaf 40 Works While They Roost

It has been demonstrated that “Black Leaf 40,” undiluted, painted on the top side of the roost will control body lice. This saves the labor of handling each bird, either to dust, dip or grease. “Black Leaf 40” does not harm the birds nor retard egg production. We regard this discovery as one of the greatest aids to poultry raising in the last generation. One ounce of “Black Leaf 40” will paint from 12 to 15 feet of roosts. One pound will paint 190 to 240 feet.

The Most Complete Line In the Rocky Mountain District

FIRST in our list of DOG FOODS is GAINES FOOD, prepared in two forms—GAINES MEAT AND MILK MEAL, and GAINES CUBES, called "KRUNCHONS." GAINES MEAL is a scientifically prepared, balanced ration for all breeds of dog's and puppies. It contains every element, every amino acid, needed to nourish every cell tissue and organ of a dog's body. This is proven by tests conducted in 1932 by Dr. John W. Patterson, B.S.A., M.S., D.V.M., the scientist who has probably done more research work in the field of canine nutrition than any other individual in the world. The following list of ingredients go into the making of GAINES FOOD—Lean Beef, Sweet Milk, Egg Yolk, Processed Beets, Soy Beans, Whole Wheat, Yellow Corn, Whole Rice, Malt Syrup, Minerals, Vylactos.

GAINES MEAT AND MILK MEAL is all ready cooked, ready to serve. It is given either dry just as it comes to you, or moistened with water, milk, or broth. GAINES CUBES (KRUNCHONS) are the same as the meal, but pressed into small cubes about ½ inch each way. They are given as is, or moistened if preferred.

PLEASE ASK FOR FREE FOLDER TELLING ABOUT GAINES FOOD AND HOW TO FEED IT. This folder contains a lot of useful information.

This picture shows a corner of our new store devoted to fish and supplies. We carry a complete line of fish globes, aquariums, foods, water plants, and anything the aquarist can use.

We do not attempt to catalog all of the items carried in stock. Out-of-town customers are urged to come in and inspect our varied pet supply line. We believe that we have just about every worthwhile item that goes with an up-to-date pet supply store.

We are continually adding to our tropical fish line. We have ample space for this purpose and as fast as we determine what varieties will do well in the average home we will add them to our stock.

This plant feeding test reported in U.S. Department of Agriculture Bulletin 340 lets you see why you get wonderful results from Vigoro. Plants 1 to 5 and 7 to 10 were fed all necessary elements except one, as noted. **Plant 6 received all elements.** Vigoro supplies plants with all elements they must get from the soil.

**YOU CAN ACHIEVE RICH GARDEN BEAUTY!**

You can grow beautiful lawns and flowers as pictured in this catalog. Disappointments are most often the result of half-starving or improperly feeding your plants.

Assure success by giving everything you grow a square meal of VIGORO.

Vigoro is different! It is a complete plant food that contains all of the elements plants must get from the soil instantly ready for the plant's use. Bone meal, manures, and sewage supply only one, two, or at most three elements and these must first be released for use by decay, a process that's slow in spring when plants need food most.
